

Functional & Performance Testing Report

GenAI / Automation Model Test Scenarios & Execution Results

Date:	30 September 2026
Team ID:	SWTID-2026-1128
Project Name:	Auto Ticket Classification using Flow Designer
Maximum Marks:	4 Marks

1. Test Plan & Scope Overview

This document summarizes the Functional Testing (FT) and Performance Testing (PT) scenarios executed for the Auto Ticket Classification System utilizing ServiceNow Flow Designer and Natural Language Understanding (NLU). Testing validates input handling, automatic classification logic, REST API connections, response latency, and system behavior under load.

2. Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Text Input Validation (e.g., ticket description, issue summary)	Enter valid and invalid text in ticket description input fields (special characters, empty text, script tags)	Valid inputs accepted; invalid inputs produce clear user-friendly error messages	Form validated input correctly and sanitized special characters	Pass
FT-02	Number Input Validation (e.g., priority scale, urgency rank, ticket count limit)	Enter numbers within (1-4) and outside (0, 99) the valid priority/urgency range	Accepts valid priority values (1-4); shows error for out-of-range inputs	Input restricted to 1-4 scale; out-of-range values rejected gracefully	Pass
FT-03	Content Generation / Auto-Classification (e.g., Category, Subcategory prediction)	Provide complete ticket descriptions (e.g., 'Wi-Fi keeps dropping in Room 302') and trigger classification	Correct Category ('Network') and Subcategory ('Wireless') generated based on input	Flow Designer assigned Category: Network, Subcategory: Wireless with 94% confidence	Pass
FT-04	API Connection Check	Verify REST API connection between Service Portal, Flow Designer, and NLU Engine using authenticated API key/OAuth token	API responds successfully with HTTP 200 OK and valid JSON response	API connected successfully; authenticated token validated	Pass
PT-01	Response Time Test	Use automated performance timer to measure end-to-end ticket classification and routing time	Classification and ticket creation process completes under 3 seconds	Average processing and classification time recorded at 1.42 seconds	Pass
PT-02	API Speed Test (Concurrent Requests)	Send 50 concurrent API classification requests simultaneously using JMeter / API test suite	API processes concurrent calls without throughput degradation or connection timeouts	Handled 50 concurrent requests with 0% error rate and consistent throughput	Pass

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
PT-03	File Upload Load Test (e.g., diagnostic logs, screenshots, PDFs)	Upload multiple PDF/log attachments concurrently during ticket submission and verify flow execution	Attachment processing works smoothly without crashing or stalling flow execution	Files processed and attached to incident record smoothly without system crash	Pass
