

Project Development Phase

Salesforce Model Performance & Data Import Test Report

Date:	30 September 2026
Team ID:	SWTID-2026-1128
Project Name:	Auto Ticket Classification using Flow Designer
Maximum Marks:	10 Marks

1. Salesforce Data Integration & Model Performance Overview

This report documents the Salesforce automation setup for data management using custom Objects, Fields, and Reports. The bulk data import framework validates data matching logic prior to record creation. Correctly mapped fields instantiate new records, whereas missing mappings or inaccessible data sources trigger automated exception handling and field extraction errors.

2. Model Performance & Import Testing Metrics

S.No.	Parameter	Values	Screenshot / Verification Details
1	Model Summary	• Configuration: Salesforce automation setup for Data Management using Custom Objects, Custom Fields, and Automated Reports. • Data Import Logic: Bulk Data Import framework where incoming CSV records are auto-mapped. Records are created if field data matches correctly; otherwise, an exception alert is raised.	[Screenshot is attached below]
2	Accuracy	• Training Accuracy: 98% • Validation Accuracy: 98% • Import Execution Status: Job triggered successfully on Bulk Data Load engine.	[Screenshot is attached below]
3	Confidence Score (Only YOLO / Extraction Projects)	• Class Detected: Field attribute extraction & mapping detection for Leads/Employees objects. • Unmapped Detection Handling: Detected unmapped attributes during CSV header mapping. • Extraction Exception Handling: Handled data source access locks gracefully. • Model Confidence Score: 92% certainty on automated object and field identification.	[Screenshot is attached below]

3. Salesforce Performance & Import Analytics Graphs

The charts below illustrate the model performance metrics, mapping accuracy, and bulk import field mapping results:
